

How to install Python Package

By Yongjun Choi, iCER Research Consultant

We usually install software for our users. However, due to the large number of packages in various version combinations of python packages, we would encourage users to install python packages in their home directory or research space.

We recommend users use Anaconda (goo.gl/urTUsR) to install dependencies and packages. Through Anaconda, user can easily install almost all python package. If you have any questions towards the installation, please come to iCER office hours (Mon/Thur, 1pm-2pm, BPS 1440) for help.
